MOI Community Call #4 (Powering the Network)

zenz

***ZenZ Solutions** — AI and Web3-as-a-Service platform enabling enterprises to seamlessly transition from Web2 to Web3.*

XOOG Built by ZenZ. Powered by MOI. Securing enterprise email & attachments

Web3 Is Hard, But Necessary

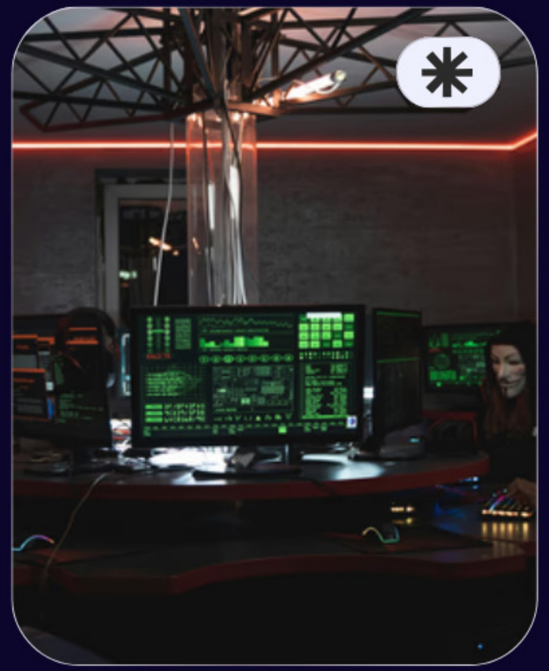

Web3 is powerful but complex.

Integration, privacy, and identity challenges create friction
Web2 works. Web3 promises. But they don't talk to each other
Silos, fragmented tools, and stalled adoption are common

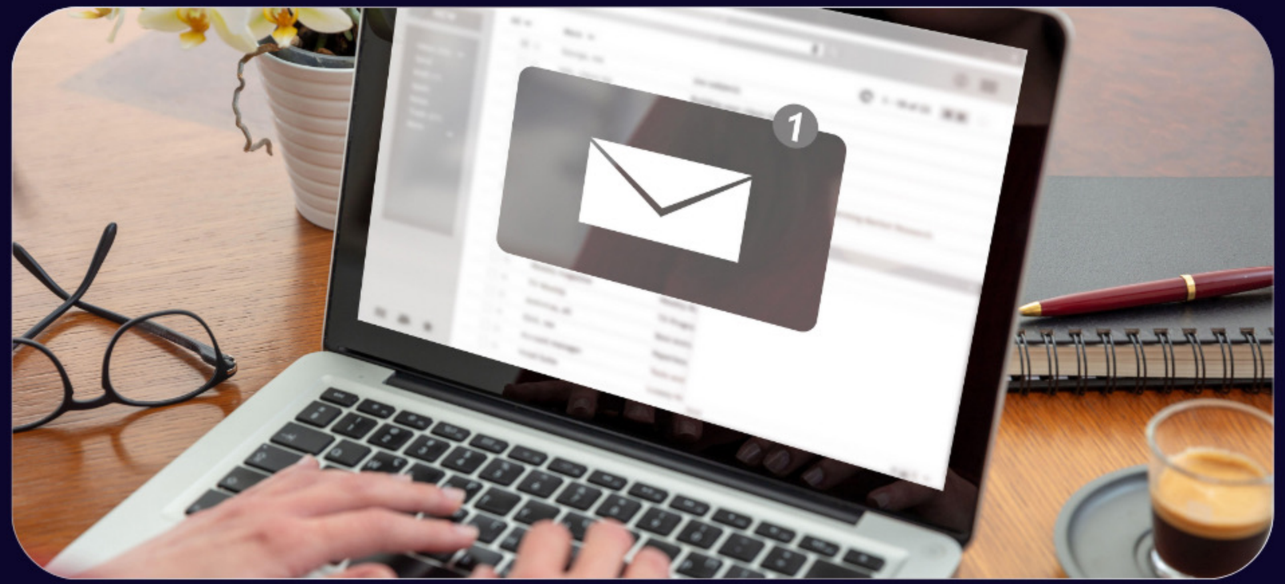

Complexity slows adoption; interoperability is missing

Why Web3 Matters

Web3 is inevitable

Privacy, compliance, and ownership demand Web3-grade solutions

Enterprises must move from centralized control to secure, user-driven systems

Web3 must happen — MOI makes it possible

91%

of breaches start with email.

Email: The Weakest Link

85% of attachments contain sensitive information

Encryption adoption remains below 10%

Email is the most vulnerable enterprise channel

We start where it matters most

How XooG Secures Enterprise Email Communication

One-click encryption inside Outlook

End-to-end privacy for messages & attachments

Time-limited access and multi-org control

No new apps or crypto setup

Web3-grade security in familiar workflows

Trusted by Early Adopters

Early adopters across industries rely on XooG to secure business-critical email and data communications.

Why MOI Is the Right Choice

Built for adoption, not abstraction

- Decentralized control with centralized ease
- Participant-centric, context-aware, and scalable
- Regulation-ready (GDPR / DPDP compliance)

MOI makes complex Web3 logic simple

The Future of Trusted Communication

From secure email to a secure ecosystem.

XooG is only the first phase; next comes chat, files, and collaboration.
MOI ensures interoperability across all communication layers.
Real privacy becomes invisible but indispensable.
Web3 done right feels like Web2—only safer.

Built on MOI | Driven by Context | Powered by People.

Thank You

Secure your enterprise email communications today

TECH UPDATE

DevRel Update

We’re kicking off a University Grant Program for student developers across the crypto community.

It’s a 12-week program where participants will:

- Build a full-stack dApp,
- Publish technical articles,
- And receive regular mentoring from the MOI team

Interested devs reach out to:

TECH UPDATE

Babylon Testnet Progress

Go-MOI (v0.1.0 → v0.11.3, 38 releases)

- Major upgrades to networking performance and security
- Complete KBFT redesign, reducing consensus time 12s → 4s
- Deep instrumentation layer: metrics, tracing, observability hooks
- Introduced Battleground: unified E2E testing and chaos platform for MOI
- Upgraded ISM with domain-specific interaction types
- Added Context Inheritance across logics and assets
- Integrated PoXt — human-centric sybil-resistance system

Voyage Explorer (v0.1.0 → v0.8.0)

- Delivered full core explorer experience
- Validator dashboards with performance and uptime metrics
- Complete public API suite to access testnet data
- Developer tools: Logic Lab, Asset Lab, Faucet
- Real-time network analytics dashboards

CoCo Runtime (v0.1.0 → v0.7.0) & PISA (v0.1.0 → v0.5.0)

- Safe actor-state access/mutation from logics
- Atomic storage layer for deterministic logic execution
- Compute + storage metering for fair resource accounting
- Robust cross-logic call support
- Fully support for native assets

TECH UPDATE

Introducing GIZA TestNet

Launching Early January

A brand-new incentivized testnet — bigger, faster, and smarter.

Full PoXt Integration

Human-centric Sybil resistance support.

Multi-Language SDK Suite

Build complex applications without hassle.

Domain-Specific Interactions

Native support for richer, intent-aware interaction types.

Performance & Resilience Boosts

A significantly faster, more robust network powered by upgraded KBFT and runtime improvements.

CipherNode MOI

About

- DePIN Platform that simplifies node hosting for everyone - from developers to institutions.
- A no-code platform that automates setup, deployment, and uptime monitoring.

COMMUNITY PARTNER

CipherNode

The Reality Today

- The system was designed to be decentralized — but the entry barriers made it the opposite

COMMUNITY PARTNER

CipherNode

CipherNode MOI

The Reality Today

- MOI redefines what it means to be a validator.
- It's PoXt democratises node operators
- No high capital, no deep technical setup — just intent and internet.
- Even a college student can host a node.
