WELCOME

MOI Community Call #5

The MOI Winter Upgrade – What's Coming in 2026

MOI
THE YEAR OF TRUST
MOI 2026
The Trust OS for the Digital Economy
Built on Thinking Networks

The Triple Convergence of 2026

01

Tokenization

$17T

- Fragmented, unsafe, and not enterprise-ready.
- $3B+ lost to exploits.

02

Agentic AI

$5T

- Exploding capability, zero accountability.
- No interoperability.
- No trust rails.

01

Near-term Quantum Threat

5 Years

- Current cryptography will break.
- No structural security path.

Fundamental Need for this Convergence: Integrated Trust

Trust = Safety + Scalability + Reliability

But trust today is bolted on

Patched with middleware, policies, and audits.

> **Why? Because computation was never designed with WHO as a fundamental dimension.**
>
> The participant has always been an afterthought.

The 70-Year Error

All computation is built for information. But the economy runs on value.

INFORMATION

Cartesian Semantics

- Can copy freely
- Can delete freely
- WHO is external (user)

Used for: Data, files, messages

→

VALUE

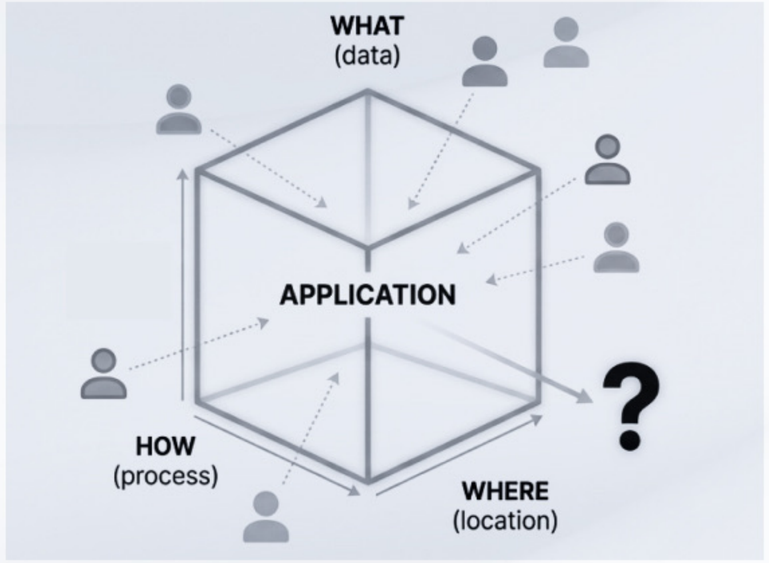

Linear Semantics

- Cannot copy (ownership)
- Cannot destroy (conservation)
- WHO is intrinsic (participant)

Required for: Ownership, assets, trust

Every system that handles value is fighting its own architecture.

Today's Computation is Missing its most Critical Dimension: The WHO

Core Problem Analysis: Current systems are app-focused. They compute using WHERE, WHAT, and HOW, but they lack the fundamental primitive of WHO (the Participant).

The Consequence

- Without WHO, trust cannot travel with the participant. Every app is an isolated silo.
- Your identity, data, and trust relationships are scattered and controlled by others.

Fragmented
Unsafe
Unscalable
Unreliable

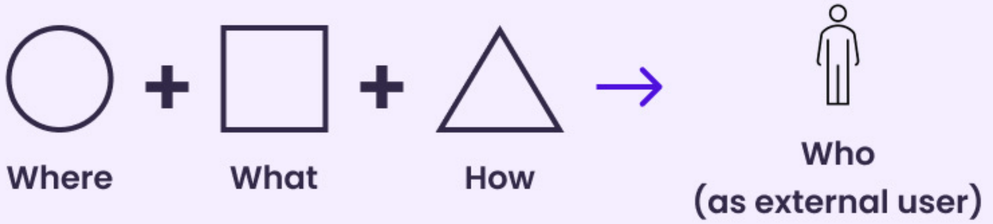

Systems

The Fix: Contextual Compute

Restoring the correct computational order

Traditional Computation

- The participant is an afterthought
- The system is primary

Contextual Compute

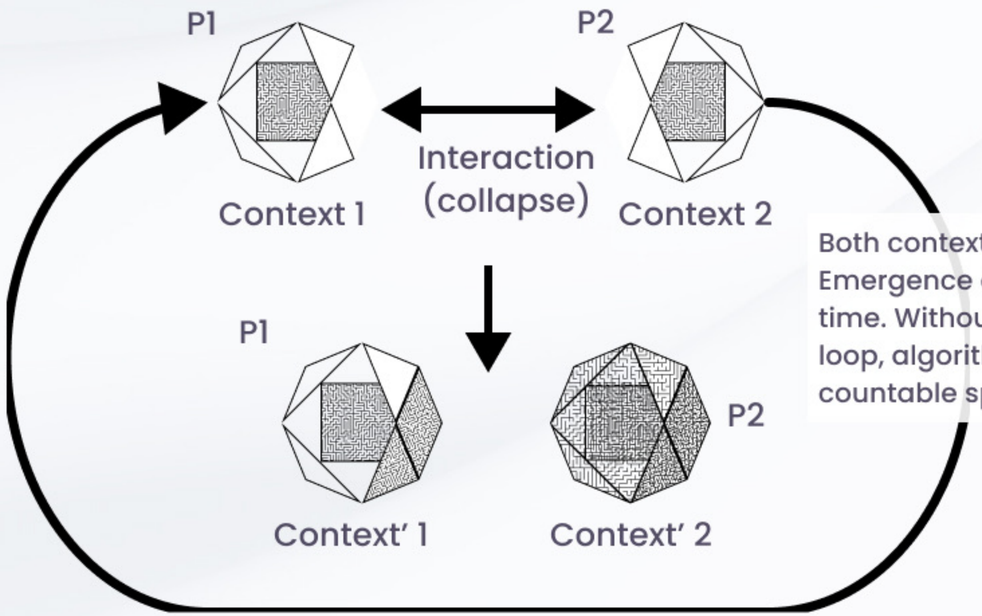

- The participant is an afterthought
- The system is primary

This is not an enhancement. It is a reordering of the fundamental hierarchy.

How Contextual Compute Works:
The Participant, Interaction, Context (PIC) Model

Intelligence, value, and trust do not emerge from algorithms alone. They require a collapse from uncountable possibility into countable actuality. The PIC model is this collapse mechanism.

Both contexts are updated. Emergence accumulates over time. Without the WHO in the loop, algorithms spin in countable space forever.

The PIC Elements

Participants (WHO)
Humans, agents, devices. First-class primitives.

Interactions:
The collapse function. Bilateral exchanges that update context.

Context:
The computational WHO. Persistent, owned, non-replicable state.

Thinking Networks, built using Contextual Compute

Where intelligence lives in the network, not just the applications

TRADITIONAL NETWORKS

"What data is moving?"

Data pipes. Dumb infrastructure. Intelligence at endpoints only.

THINKING NETWORKS

"WHO is interacting?"

Participant networks. Intelligence in the network itself.

IFP/CP

Participant-centric protocols

KRAMA

Contextual consensus

PIC Model

Value from possibility

The loop must include WHO. Without it, algorithms spin forever.

MOI: More than blockchain

The Trust OS – built on a new computing paradigm

8. Applications	→	Web2, Web3, AI Agents, Enterprise
7. Infrastructure Products	→	Products (ZenZ, SAGEO, StiFF)
6. Access	→	VOYAGE Platform, SDKs, APIs
5. Networks	→	(MOI Chain, MOI ZEN)
4. Mechanisms	→	KRAMA, PoXT, MDAG, ISM, PISA, CoCo
3. Protocols	→	IFP, CP
2. PIC Model	→	Participants, Interactions, Context
1. Contextual Compute	→	Contextual Compute (WHO as Primary)

THINKING NETWORK

The network understands WHO is interacting, not just what data is moving.

TRUST OS

Foundational layer for any application to build trusted interactions.

Apps login to YOU, not you to apps.

The Inevitable Evolution of Digital Trust

GENERATION 1

Trust Through ASSETS

Bitcoin, 2009

Delivered:

Value transfers without intermediaries.

Limitation:

Network-centric and slow. Trust in infrastructure (miners decide).

GENERATION 2

Trust Through CODE

Ethereum, 2015

Delivered:

Programmable value transfers.

Limitation:

App-centric and fragmented. Trust in code (developers decide).

GENERATION 3

Trust Through CONTEXT

MOI, 2025

Delivers:

Contextual value transfers with emergent intelligence.

Benefit:

Participant-centric and unified. Trust in participants (context decides).

Evolution Complete: Assets → Code → Participant

The Trust OS is Ready

2,100+	12+	3	$500K+
Live Validators	Months Production	Active Testnets	ARR (Pre-Token)

40x More Capital Efficient

- Traditional L1s: $100M+ raised before production
- MOI: $7M invested → live, revenue-generating production network

R&D	IP Portfolio	Strategic Partners
7 Years	Global Patents	50+

Production before token. Revenue before speculation.

2026: The Year of Adoption

Enterprise First. Solution Focused. Three Trust Layers.

Trust For Value

StiFF

Safe Token Infrastructure for tokenization, programmable money, and compliant value transfer.

Context-aware • Compliance native • Participant owned

Trust for Agents

SAGEO

Agent Context Trust Protocol (ACTP). Connectivity + Discovery ≠ Trust. We provide the trust rails.

Verifiable authority • Immutable accountability • Stateful orchestration

Trust for Business

ZenZ

Enterprise trust layer for identity, data, and communication. IOME + XooG + Kapsul.

Web2 ↔️ Web3 bridge • DID-powered • Context-aware storage

The Uniswaps of MOI — category-defining protocols

2026: Technology Roadmap

New Interaction Types

- Direct file management interactions
- Business-specific interaction patterns
- Enterprise workflow integration

Business SDKs

- Blockchain invisible to users
- Enterprise integration, no crypto complexity
- Blockchain is the DB, token is the vehicle

Context-Aware Quantum Security

- Adaptive cryptographic selection
- ECDSA to SPHINCS+ based on context
- Structural security anchored in WHO

Network Growth

- Multi-language SDK support
- Enterprise-grade SLAs

10,000+
Nodes target

The Quantum Problem
Only We Can practically Solve

5-year threat window. Legacy chains face an impossible upgrade path.

THE PROBLEM

Traditional Chains

- Single signature scheme network-wide
- Upgrade = hard fork or network split
- If you go quantum, you block everyone else
- Global state = global vulnerability

→

MOI'S SOLUTION

Context-Aware Cryptography

- Signature selection per interaction
- ECDSA today, SPHINCS+ tomorrow
- Your quantum choice doesn't affect me
- Context separation = infinite blockspace

Security Model	Upgrade Path	Result
Structural, not Protocol	**Per-participant, not network-wide**	**Future-proof by design**

Mainnet and Token Launch

Q2 2026

Mainnet Launch

- Full production network
- Enterprise-ready infrastructure
- Complete product suite deployed

Token Utility

Network Security	Staking	Settlement	Governance

Technology with a token at the backend

Not the other way around.

Revenue
before speculation

Production
before promises

Why Our Token is Different

Demand driven by enterprise usage, not market speculation.

MOST L1 TOKENS

Token → Hope for Technology

Raise $100M+ pre-product. Spend $50M+ on grants and incentives. Hope users come. Dependency on crypto market cycles.

Demand Source

Speculation + Grants

MOI TOKEN

Technology → Token at Backend

Enterprise pays in fiat via SaaS contracts. 20% automatically flows to MOI to anchor trust on-chain. Every user becomes community member.

Demand Source

Enterprise Revenue (Predictable)

THE FLYWHEEL

$500K
ARR before token launch

$5M
Qualified pipeline

Revenue → Token Demand → Network Security → More Revenue

Not a token with hopes of technology adoption. Technology with a token at the backend.

2026: The Critical Year

For the Community

Node Operators

Scale to 10,000+ validators

Developers

Build on StiFF, SAGEO, ZenZ

Enterprises

Deploy the killer platforms

For the Ecosystem

Mainnet Launch

Full production network Q1

Token Launch

Token Launch

Enterprise Wave

Strategic partnerships activated

The Stack is Ready. The Market is Ready.
Now We Execute.

The question isn't whether this infrastructure will exist.
The question is: who defines it?

DEV UPDATE

The "Missing Layer" in the Agent Economy

Connectivity ≠ Accountability

The Current State

Protocols like Google A2A & MCP solve connectivity (the pipes), but ignore trust.

The Gap

Agents can communicate, but lack verifiable identity or history.

The Problem

A "Black Box" ecosystem where users cannot verify if an agent actually performed the work it claimed.

DEV UPDATE

Introducing Sageo

The Trust & Discovery Layer for AI Agents

Verifiable Identity

A universal "Passport" for Agents (Owner, Skills, Endpoint) stored on-chain

Interaction Proofs

Cryptographic evidence of every request and response—creating an immutable history.

Reputation via Action

Discover agents based on proven track records, not just marketing descriptions.

MOI Native

Leveraging the Participant-Centric model to treat every Agent as a unique network actor

DEV UPDATE

Realizing the Vision

Building with MOI Forge & Boiler Blockchain

MOI Forge Program

Incubating critical infrastructure for the decentralized web.

Engineering Partner

Built by Boiler Blockchain (Purdue University), tackling the "hard problems" of proxy interception and hashing.

Roadmap

High-fidelity MVP targeting end-of-semester release

Next Up

Deep dive into the Architecture & Logic

GUEST SPEAKER

Sahil Sheikh - Project Manager, Boiler Blockchain <> MOI Forge

Agent identity

- Registering AI agents as actors on MOI
- Gives each one of them their own “identity”
- Txs/Interactions are recorded in their state as context

Built on top of A2A

- A2A still remains the communication standard
- Sageo acts as a proxy, recording key information and putting it on-chain
- Enables Auditability

Context Portability

- Agents don’t go in blind when interacting with users
- They have previous context
- The network remembers user—agent interactions

Dev-friendly

- Sageo can be plugged into their current agent workflows
- Registering and managing agent data would be super easy

COMMUNITY

MOI Technology Ecosystem Odyssey Campaign

Community members are actively completing quests and accumulating points that will convert into future ecosystem rewards.

Telegram AMAs

With Crypto Astronauts

AMA brought a major growth spike

- 2,800+ new Telegram members in one day.

Discussion focused on:

- Developer adoption
- MOI Forge
- How MOI enables the Thinking Network layer

Shows strong organic interest from builder-heavy audiences.

X Space AMAs

With Crypto Astronauts

One of our biggest wins this month.

5.5K live listeners

125K total reach after the replay circulated

Aditya covered:

- MOI Forge
- Vision of the Thinking Network
- Our long-term mission

Community Call #4

Our best-performing call yet

- 89 attendees
- ~90% retention across the session

Shows the community is not just joining — they're staying, listening, learning, and engaging.

Community Calls are becoming a key anchor for MOI Community Updates

YouTube Growth

Solid growth in the last few weeks

- 118 new subscribers
- 1200 viewers
- 93% new viewers

Forge episodes, community call recordings, and explainers are consistent performers.

YouTube is quietly becoming one of our strongest awareness + education channels.

COMMUNITY

MOI Campus Roadshow

SSIT Tumkur (Dec 5–6)

- 2-day bootcamp successfully completed
- 80+ students participated
- Certificates issued via CipherNode
- Strong interest in MOI from university tech clubs

Presidency University

- Invited to the Board of Studies meeting
- Discussed curriculum for upcoming blockchain track
- Next steps:
  - Move to MOU discussions
  - Include MOI in coursework
  - Conduct future bootcamps & workshops

What this means:

- Academic interest in MOI is real and rising
- We're building the next generation of MOI developers and contributors

BANANA UPDATE

Moinkee, Intern - MOI

COMMUNITY

How to get involved

- Follow roadmap announcements on X + Telegram
- Continue participating in Moinkee, Odyssey, and ongoing campaigns
- More updates and Community Call #6 details coming soon
